

Remotely sensed land cover heterogeneity

Mao-Ning Tuanmu

6/26/2012

Heterogeneity Metrics

- Texture measures
 - First-order & second-order
 - NDVI & NDMI (Normalized Difference Moisture Index)
 - GLS 2000 Landsat imagery
- Landscape metrics
 - Categorical land cover data
 - NLCD2001 (Landsat imagery around 2001)
- Data layers of these metrics with the resolution of ~ 500 m (consistent with MODIS 500-m data)

Two Approaches

- Moving-window approach

- Fixed-grid approach

Two Approaches

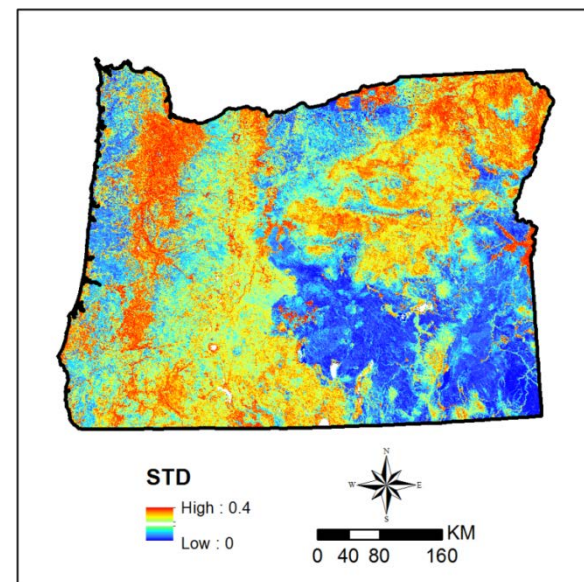

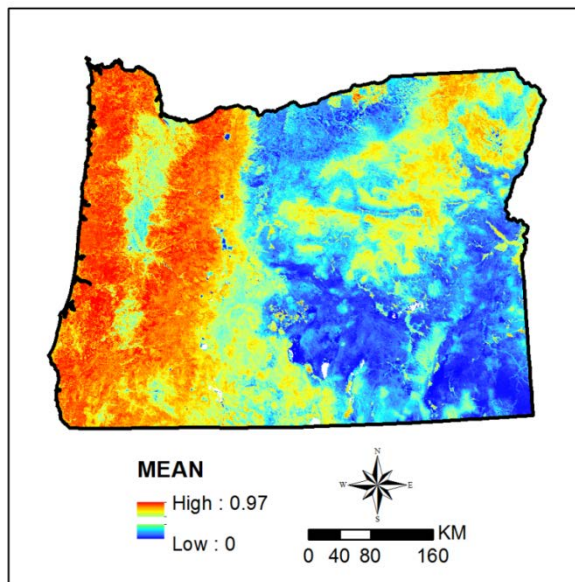

- Moving-window
 - Texture characteristics at different scales
 - Computation-intensive (\sim one month for one metric with a 3x3 window)
 - Containing surrounding information
- Fixed-grid
 - Heterogeneity within a specified area
 - \sim 2 days for all (i.e., 10) second-order texture measures

Two Approaches

- Metric values calculated with the two approaches are highly correlated
 - Absolute values of Pearson's $r > 0.85$ for all texture measures except the second-order correlation (0.71)
- Metric values at different scales are highly correlated
 - Pearson's $r > 0.94$ between 3-by-3-pixel and 11-by-11-pixel moving windows for first-order standard deviation and second-order homogeneity

Texture Measures

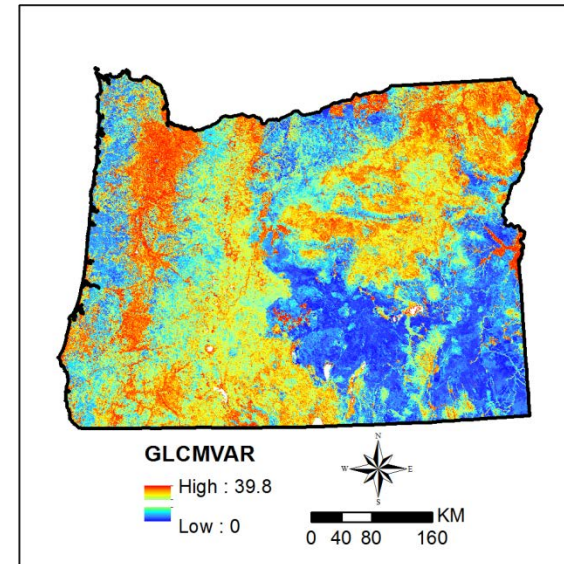

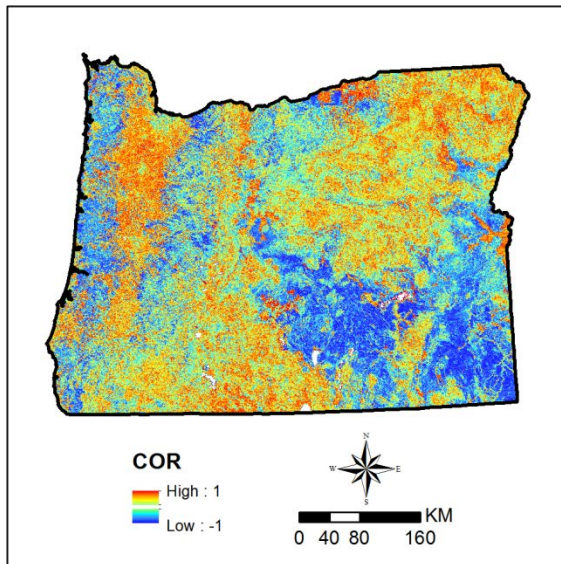

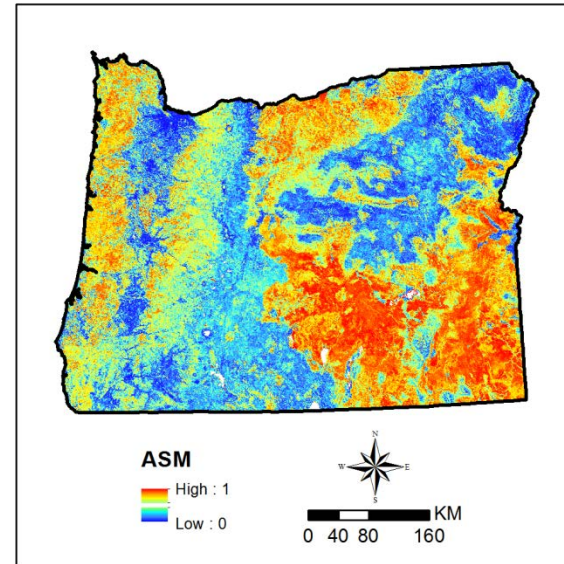

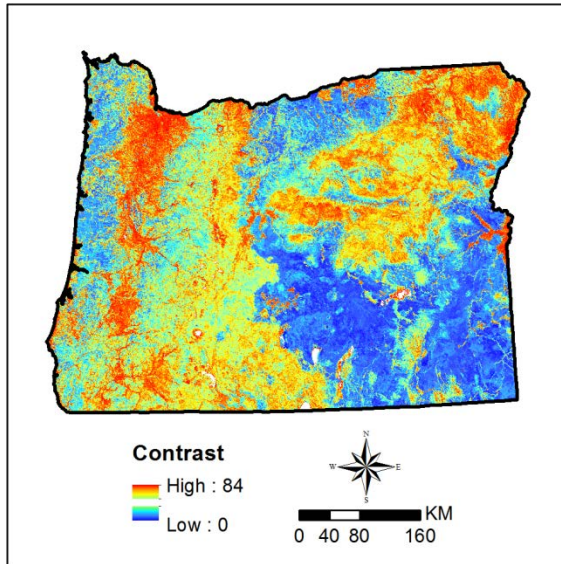

- Seven first-order texture measures
 - Mean (mean), standard deviation (std), maximum (max), minimum (min)
 - Variance (var), coefficient of variation (cv), range (range)

Texture Measures

- Ten second-order texture measures (GLCM)
 - Contrast: contrast(CON), dissimilarity (DIS), homogeneity (HOM)
 - Regularity: angular second moment (ASM), entropy (ENT), maximum (GLCMMAX)
 - Descriptive statistics: correlation (COR), mean (GLCMMEAN), standard deviation (GLCMSTD), variance (GLCMVAR)

Texture Measures

Correlations Among Texture Measures

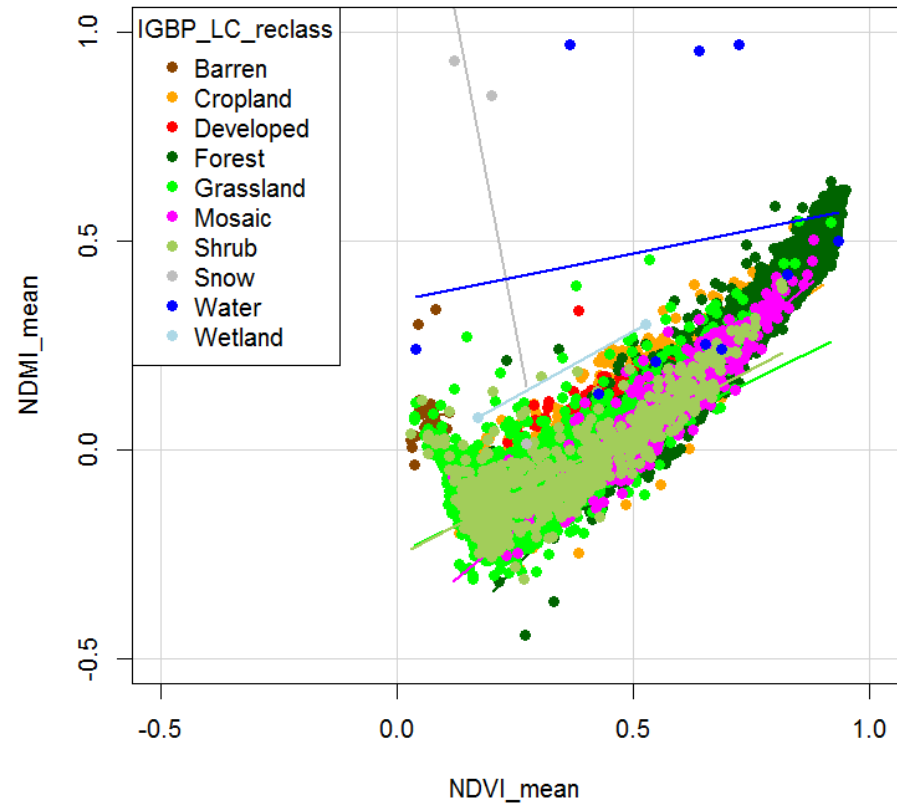

NDVI

NDMI

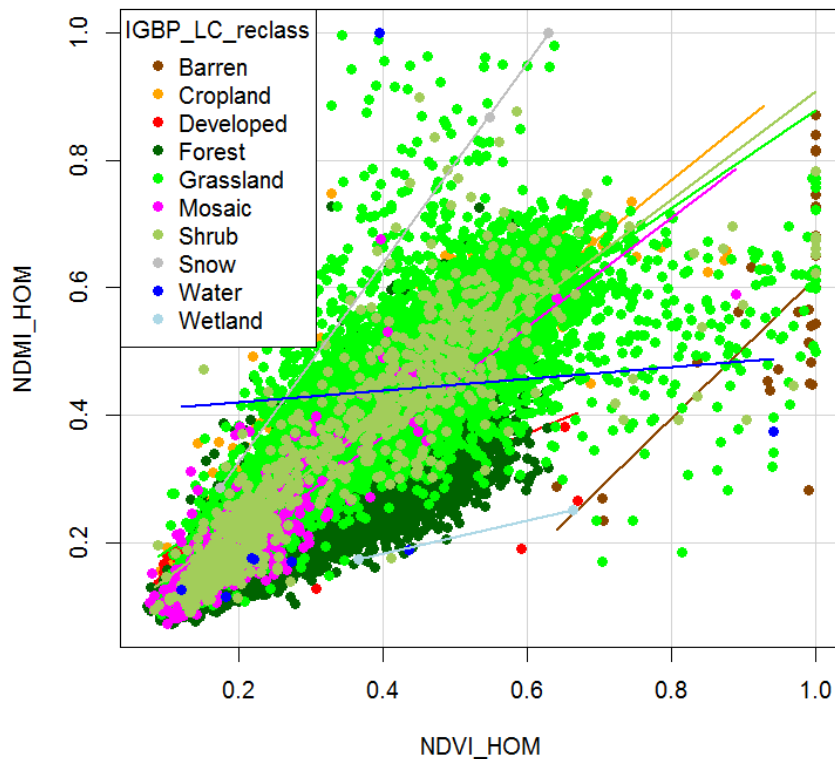

NDVI vs. NDMI

Overall R2 = 0.92

NDVI vs. NDMI

- Highly correlated (> 0.7), except for cv

Landscape Metrics

- Fragstats
 - ~ 12 hrs for 12 landscape-level and 1 class-level metrics
- SDMTools in R
 - Only for patch-level metrics
- r.le and r.li in GRASS
 - Could be an alternative to Fragstats

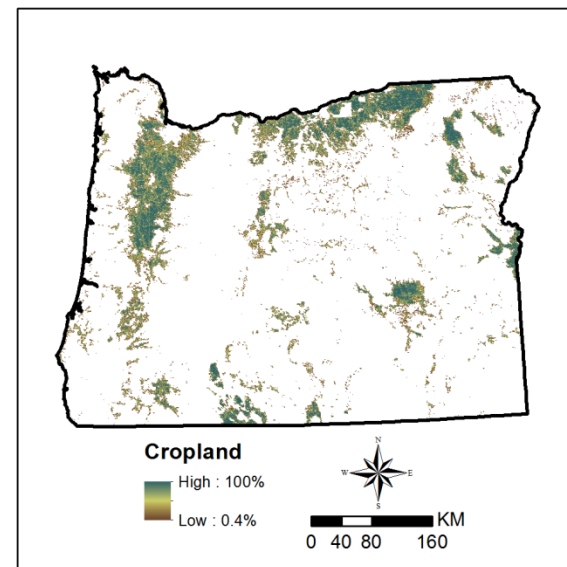

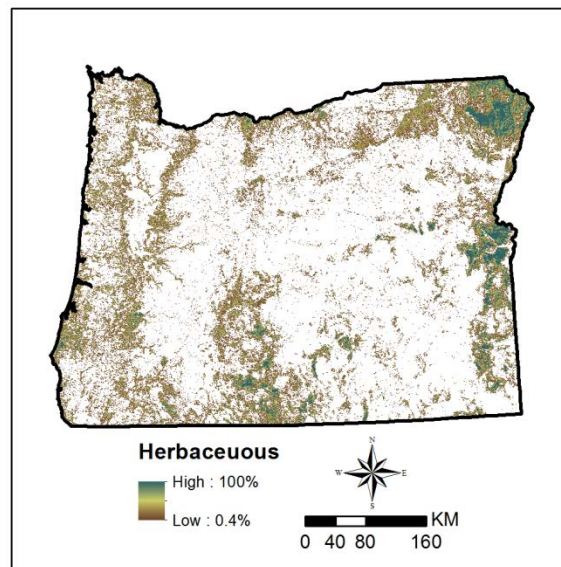

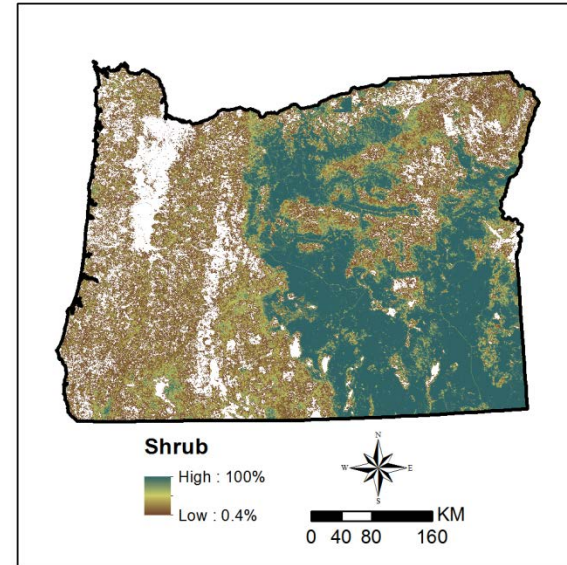

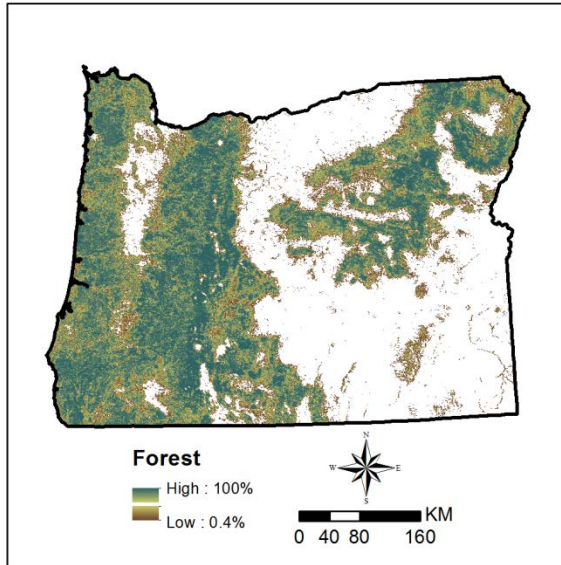

Landscape Metrics

- Class-level
 - Percentage of landscape covered by each land cover type
- Area-edge
 - Edge density (ED)
 - Largest patch index (LPI)
- Shape
 - Mean and CV of fractal dimension index (FRAC)
 - Mean and CV of area-perimeter ratio (PARA)

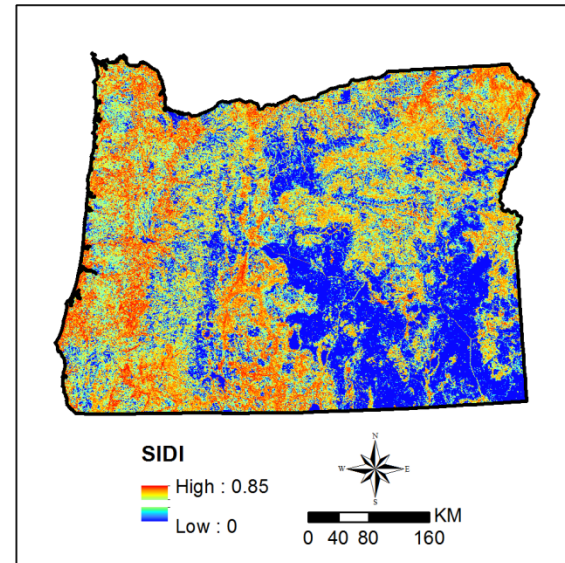

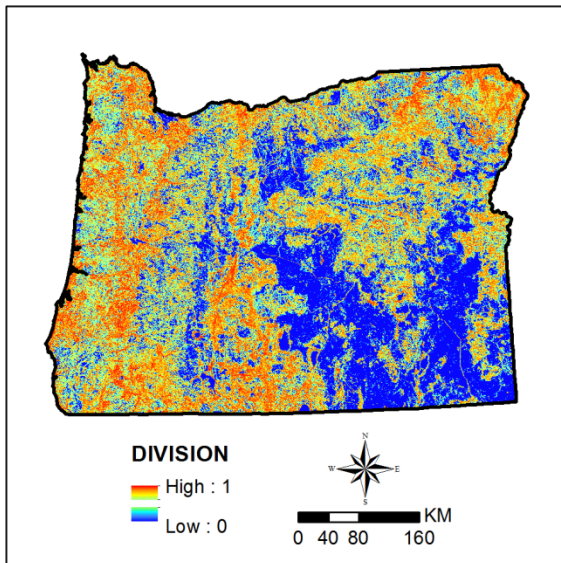

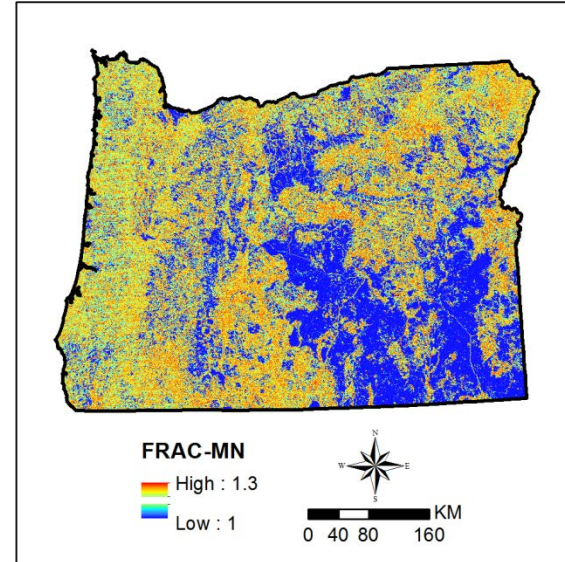

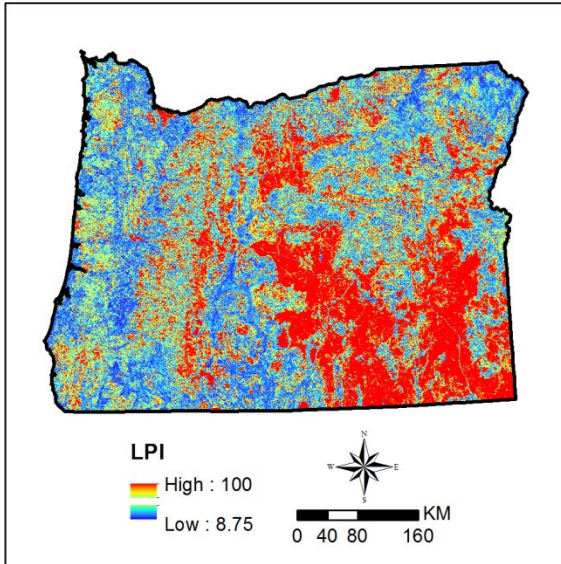

Landscape Metrics

- Aggregation
 - Landscape division index (DIVISION)
 - Mean of Euclidean nearest neighbor distance (ENN)
 - Landscape shape index (LSI)
- Diversity
 - Patch richness (PR)
 - Shannon's and Simpson's diversity indices (SHDI, SIDI)
 - Shannon's and Simpson's evenness indices (SHEI, SIEI)

Class-level Landscape Metrics

Landscape-level Metrics

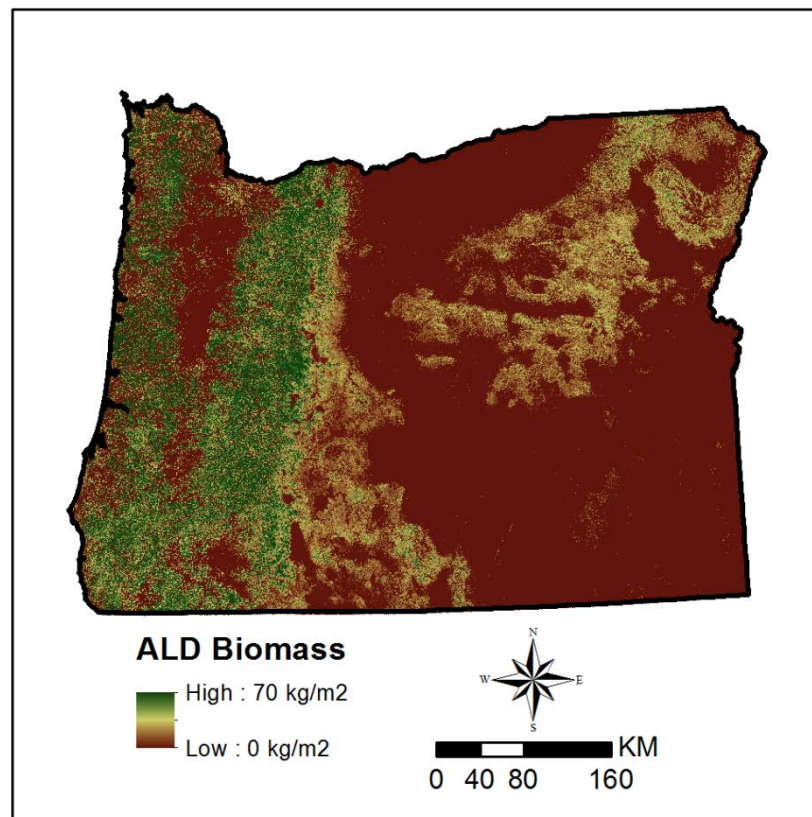

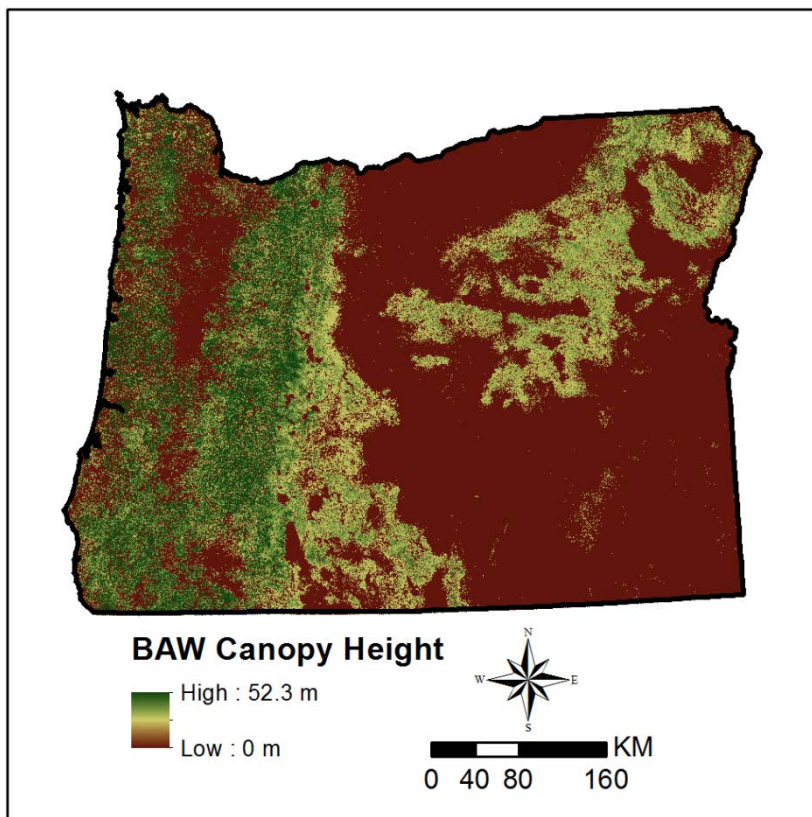

National Biomass & Carbon Datasets

- Woods Hole Research Center
- High resolution (30m) estimation of basal area-weighted canopy height, aboveground live dry biomass, & standing carbon stock
- USDA Forest Service Forest Inventory and Analysis (FIA) data
 - Canopy height & biomass
- Predictors
 - NLCD 2001 (landcover & canopy density)
 - LANDFIRE project (existing vegetation type)
 - USDA National Elevation Dataset (NED)

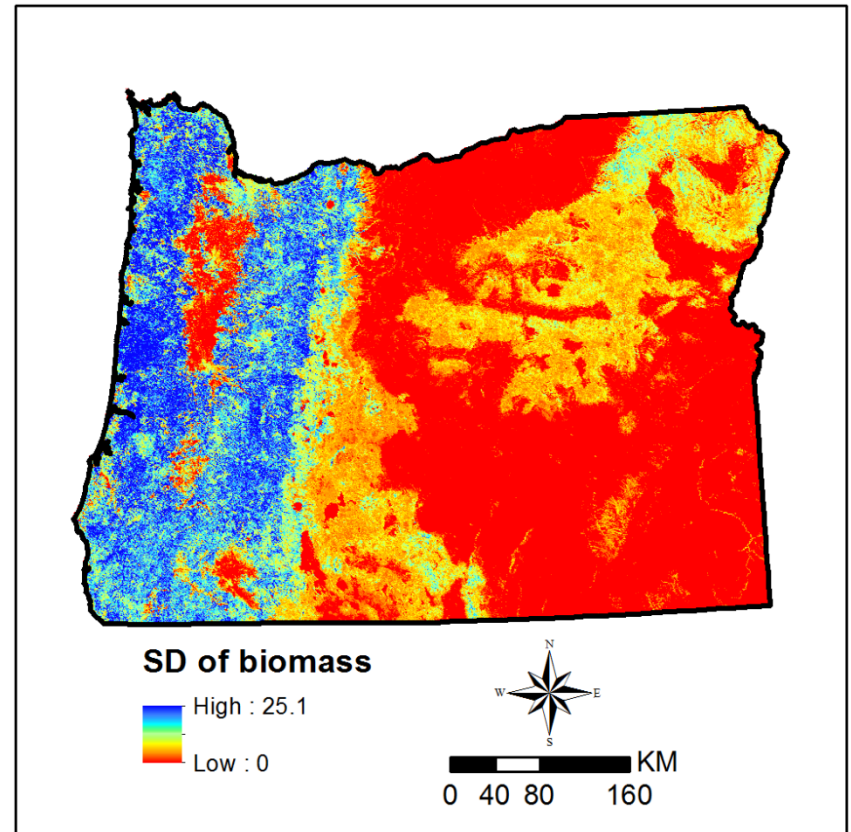

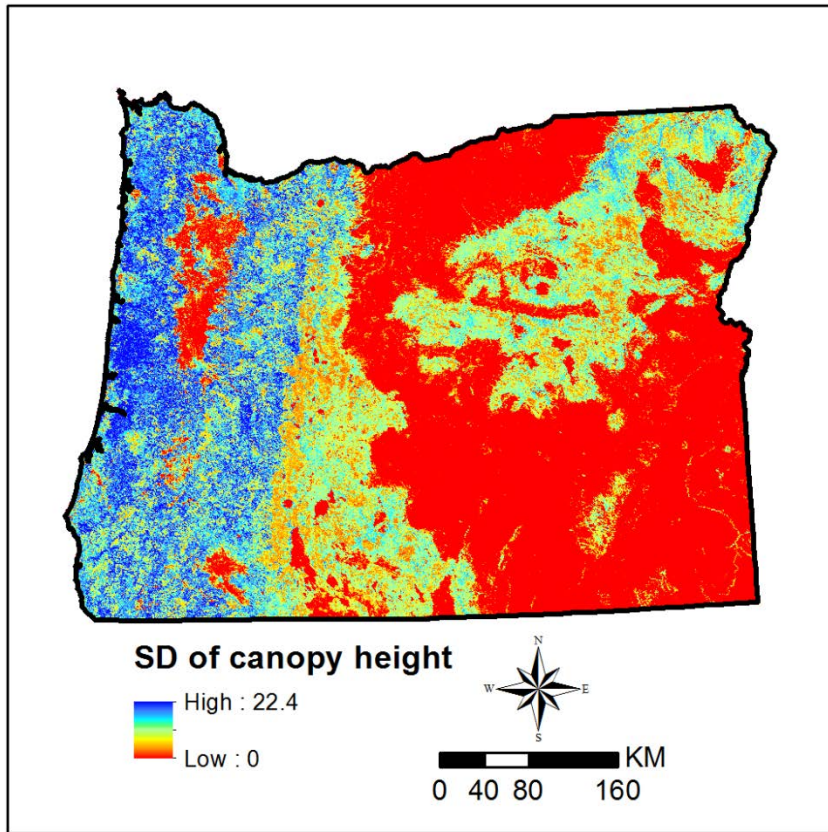

NBCD

Basal-area weighted canopy height

Above-ground live dry biomass

Heterogeneity of Canopy Height & Biomass
